

What are keywords in java?

- In java keywords are special/reserved words.
- Which means their meaning already defined in JRE(**Java Runtime Environment**).
- These words we can not use for multi purpose, like as variable name, package name, class name and method name...etc.
- In java we have **50** keywords.

For example:

```
int age = 25 // valid
```

```
String int = "India"; // invalid, because variable name is keyword(int)
```

Reserved literals in java:

true: is a boolean literal.

false: is a boolean literal.

null: is an object default value.
