

If any operator is used on three operands or variable is known as Ternary Operator. It can be represented with `? :`. It is also called as conditional operator.

The ternary operator is an operator that takes three arguments. The first argument is a comparison argument, the second is the result upon a true comparison, and the third is the result upon a false comparison. Ternary operator is shortened way of writing an if-else statement.

Advantage of Ternary Operator:

Using `? :` operator we can reduce the number of line codes, and improve the performance of application.
